CERTIFICATION & TRAINING

- The Andela Bootcamp
  2018
- The Complete Node.js Developer Course
  2019
- The Complete React Developer Course (w/ Hooks & Redux)
  2019
- MERN Stack Front to Back: Fullstack React, Redux & Node.js
  2020

SKILLS

- ReactJS/Node.JS
- ReactNative
- Typescript
- NextJS
- Database Design (Prisma/TypeORM)
- Version Control (Git/Github)
- Debugging
- Microservices
- TypeScript/JavaScript test frameworks (Jest, Supertest, Playwright, Cypress)
- CI/CD
- TDD/E2E Testing
- Agentic Coding(Claude/Antigravity)
- GraphQL & RestAPI Design

Senior software engineer with 6+ years of experience building, debugging, and owning backend systems in TypeScript and Node.js — with a strong track record in fintech, API integrations, and fraud investigation. I'm comfortable dropping into large codebases I didn't write, tracing failures end to end through logs, database records, and provider calls, and translating what I find into clear, actionable reports. I've worked across payments, identity verification, and third-party integrations — the exact domain where production issues are expensive and ambiguity is not an option.

WORK EXPERIENCE

- ChipperCash — 2024 - PRESENT
  Software Engineer
  - **Designed and implemented fraud prevention and identity verification** flows with a quality-first approach — including testability for spoofing detection, liveness checks, and document validation edge cases.
  - Wrote and maintained automated test coverage for the onboarding and KYC pipeline, covering happy paths, failure modes, and third-party stub scenarios for biometric vendors.
  - **Reduced selfie spoofing attempts by ~95%** by re-engineering the liveness and identity verification pipeline — investigating failed sessions end to end (request traces, vendor response payloads, session records) to identify the exact vectors being exploited, then shipping targeted backend countermeasures.
  - Collaborated cross-functionally with risk, compliance, and product teams to translate requirements into test plans and production-ready, quality-gated solutions.
  - Worked across time zones within a distributed engineering team, adapting quickly to varying codebases and service boundaries.
- DabbleLab Inc — 2023 -2024
  Fullstack Developer
  - Built and optimized RESTful APIs with a focus on reliability and correctness — ensuring high code quality through testing, code reviews, and adherence to best practices.
  - Authored integration and regression tests as part of CI/CD delivery pipelines for enterprise clients, including United Talent Agency (UTA).
  - **Improved API response reliability by 35%** across client integrations by auditing error handling, retry logic, and timeout configurations — then correcting the root causes rather than patching around them
  - Collaborated across distributed teams, contributing to test strategy and quality tooling across multiple production-grade systems.
  - Championed testing discipline within teams — reviewing test code and driving coverage for critical user flows.
- Degraphe — 2021 -2023
  Fullstack Developer
  - Developed and maintained web applications using the MERN Stack, ensuring responsive user experiences.
  - Utilized MongoDB to manage and optimize database for dynamic data storage.
  - Mentored junior developers through pair programming and knowledge-sharing sessions.
  - Built responsive UI components with CSS frameworks like Bootstrap and TailwindCSS.
  - Implemented security best practices to safeguard applications from vulnerabilities and threats.
  - Monitored application performance and resolved issues promptly to ensure uptime and reliability.
